The Tilt and Turn window has long been the window of choice for most of Europe. Where the UK market is used to having a smaller 'vent' window over the main opening sash, the Tilt and Turn offers the same ventilation qualities as a traditional UK style window yet incorporates them within one sash.

This gives a cleaner, simpler design that suits the aesthetics of more contemporary properties.

The advantages of the sashes opening inwards make them ideal for flats and apartments or anywhere that would necessitate outside access.

The standard colour is white although various woodgrains or any Renolit® foil colours are available on request.

SASH HINGES

The unique hinges allow each sash to either tilt inwards from the top - a restrictor prevents the sash opening in too far - or to open as a conventional side-hung sash.

HANDLES

The Tilt and Turn handles control whether the sash tilts or turns. The handle turned at 90° will allow the sash to tilt. Turning the handle 180° prevents the tilting movement but releases the lower hinge to allow the whole sash to open as a conventional side-hung window, although the sash will swing internally as opposed to externally.

EASY CLEAN

As each sash opens inwards, it means you can clean the external face of the windows from indoors - no ladders, no hassle. This makes them ideal for inaccessible locations where a ladder wouldn't be able to reach.

VENTILATION

The tilt position is excellent for ventilation even during adverse conditions as it will minimise rain or wind entering. Air is guided upwards so as to reduce draught but enables circulation as the cooler, denser air falls. For maximum ventilation both sashes can be swung fully open as on a typical side-hung window.
